## Amendments to the Specification:

Please replace the paragraph beginning at page 3, line 12 with the following amended paragraph:

The present invention is directed to a trailer <u>10</u> as illustrated in the accompanying Figures. The trailer <u>10</u> is particularly adapted to transport to a location a shipping container. The trailer <u>10</u> of the present invention allows transportation, dropping off and picking up of a container in areas where specialised equipment such as cranes, etc. is not present. In a preferred embodiment of the invention, the trailer <u>10</u> can be used on site in a field where harvesting is being performed. Without the trailer <u>10</u> of the present invention, the container cannot be located in situ.

Please replace the paragraph beginning at page 3, line 20 with the following amended paragraph:

In general terms, the trailer <u>10</u> of the present invention has a generally U-shape as illustrated in Figure 1(b), which is a top view of the trailer <u>10</u>. At predetermined locations on the frame <u>11</u> of the trailer <u>10</u>, i.e. the four corners, lifting members <u>30</u> are located which are adapted to engage the holes or lifting points <u>20</u> provided on a container <u>90</u> and to lift the same off the ground by a sufficient amount (approximately <u>30 cm to 120 cm or about 12-48 inches</u>). The trailer <u>10</u> is also provided with wheels <u>13</u> or endless tracks so that it may be moved once the container <u>90</u> has been loaded or unloaded.

Please replace the paragraph beginning at page 3, line 28 with the following amended paragraph:

Referring now specifically to Figs. 4(a) - 4(c), there is shown the trailer 10 according to a preferred embodiment. The trailer 10 consists of a generally U-shaped frame 11, provided with wheels 13 on each side of the frame 11. In the illustrated embodiment, the wheel set 13 consists of a walking axle  $\underline{24}$ , but any other arrangement of wheels  $\underline{13}$  will meet the objects of the present invention.

Please replace the paragraph beginning at page 4, line 4 with the following amended paragraph:

As can be appreciated, the frame 11 is shaped and sized to receive a container 90 therein, as better shown in Figs. 1 and 2. The container <u>90</u> is equipped, as is standard in the industry, with lifting holes <u>20</u> located at each corner of the container <u>90</u>. These holes <u>20</u> are generally located approximately <u>10 cm</u> (4 inches) below the top of the container <u>90</u>.

Please replace the paragraph beginning at page 4, line 10 with the following amended paragraph:

In a preferred embodiment, the trailer <u>10</u> is provided with vertical beams 15 which are located on the trailer <u>10</u> so as to be proximate the lifting holes <u>20</u> of the container 90. The front beams 15 are interconnected with a top cross member 17 and the rear beams 15 are interconnected with another top cross member 19. The cross <u>beams-members</u> 17, and 19 serve to increase the stability of the trailer 10.

Please replace the paragraph beginning at page 4, line 16 with the following amended paragraph:

Within each beam <u>15</u> is located a lifting member 30, which consists of a hydraulic cylinder 31 movable between an extended position (right hand side of Fig. 5) and a retracted position (left hand side of Fig. 5).

Please replace the paragraph beginning at page 4, line 20 with the following amended paragraph:

At the top of the cylinder <u>31</u> is located a lifting hook <u>33</u>. The lifting hook <u>33</u> is inwardly biased, so that <u>lifting</u> hooks <u>33</u> on the right hand side of the trailer <u>10</u>, when looking at the same from the rear are biased in a counter-clockwise direction, and the <u>lifting</u> hooks <u>33</u> on the left hand side of the trailer <u>10</u> are biased in a clockwise direction (see the arrows on Fig. 5). Preferably, a stop <u>35</u> is provided so that motion of the lifting <u>finger-hook <u>33</u> is limited in the direction of bias.</u>

Please replace the paragraph beginning at page 5, line 1 with the following amended paragraph:

When the lifting member 30 is in the retracted position, as shown on the left hand side of Fig. 5, the lifting hook 33 is located within the beam 15. This effectively "hides" the <u>lifting</u> hook 33, and provides the necessary clearance between the beams 15 and the container so that the trailer 10 can be backed up to surround the container 90, or moved forward to clear the container [[10]] 90.

Please replace the paragraph beginning at page 5, line 7 with the following amended paragraph:

When the container is ready to be picked up, as shown in Fig. 1, the container [[10]]  $\underline{90}$  fits snugly within the opening defined by the U-shaped trailer  $\underline{10}$ , and the beams 15, and consequently the lifting members  $\underline{30}$ , are located proximate the corresponding lifting hole  $\underline{20}$  on the container [[10]]  $\underline{90}$ .

Please replace the paragraph beginning at page 5, line 12 with the following amended paragraph:

The hydraulic cylinders 31 are then extended. When the lifting finger hook 33 reaches the bottom end 39 of the longitudinal slot 37, it extends out of the beam 15. Preferably, this position is just below the lifting hole 20 on the container [[10]] 90, to allow the finger-lifting hook 33 to properly deploy.

Please replace the paragraph beginning at page 5, line 17 with the following amended paragraph:

As the cylinder 31 is further extended, the lifting finger-hook 33 engages the lifting hole 20 of the container 90, and gradually lifts the container 90 off the ground, until the top of the container 90 reaches the bottom of the top cross members 17, 19. Thus, the length of the slot 37 essentially corresponds to the distance the container 90 will be lifted off the ground.

Please replace the paragraph beginning at page 5, line 23 with the following amended paragraph:

This is better shown in Fig. 2, showing the container <u>90</u> lifted off the ground and ready for transport.

Please replace the paragraph beginning at page 5, line 26 with the following amended paragraph:

Figure 3 schematically illustrates the hydraulic circuit for the trailer <u>10</u>. One important aspect is that the four cylinders <u>31</u> extend and retract substantially at the same rate, to prevent buckling of the trailer 10.

Please replace the paragraph beginning at page 5, line 30 with the following amended paragraph:

As is usual, the frame 11 is provided with means, such as a fifth wheel <u>26</u>, to attach the trailer 10 to a tractor 22.

Please replace the paragraph beginning at page 6, line 1 with the following amended paragraph:

In another preferred embodiment, the trailer 10 is further provided with a gate <u>100</u> at a rear end thereof, in order to further increase the stability of the trailer <u>10</u>, particularly one that has been loaded, and to compensate for torsion loads.

Please replace the paragraph beginning at page 6, line 5 with the following amended paragraph:

Consequently, the trailer  $\underline{10}$  can be used to drop and pick-up a container  $\underline{90}$  in a particular location. When the container  $\underline{90}$  is ready to be moved, the trailer  $\underline{10}$  is approached to the container  $\underline{90}$ , the frame  $\underline{11}$  is made to engage the holes  $\underline{20}$  and the container  $\underline{90}$  is lifted off the ground and driven away.
